

The second half

- **Pool-Sequencing in species without a genome**
 - What it is
 - Validation
 - An example from my lab
- **RNA-Seq**
 - Things to think about for those working in non-model species

Insect Life Cycle Functional Genomics

Pararge aegeria

Polygonia c-album

Lycaena tityrus

Colias eurytheme

Euphydryas editha

Our goal

- Find high quality candidate SNPs directly associated with local adaptations
- Spend our effort studying functional effects of SNPs on fitness in the lab and wild, not on finding the SNPs
- Learn how these adaptations are integrated

**Group
1**

**Group
2**

**What's the genetic
difference?**

**In 2015, how should we
answer this?**

Just sequence it!

Group
1

Group
2

What's the genetic
difference?

What's the cheapest/easiest experimental design?

- Sequence the be-jesus out of each group
 - >25 X genomic coverage of >50 haploid genomes per group
- Make a simple genome & map this data to it!
- Use good stats to ask what regions are different
- Figure out what those regions are
 - Invest your resources in these regions and their functional role

Pool-Seq approach in model species

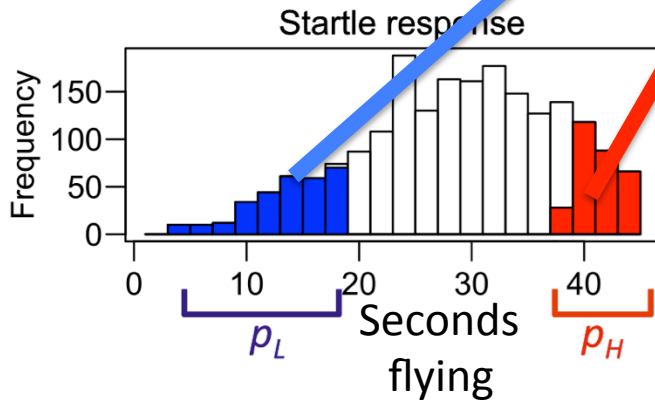

Low pool (n=300)

High pool (n=300)

Map to genome

Call SNPs

Scan genome for sig. allele
freq. changes between
groups

61 SNPs show sig association with startle response

Huang et al. 2012 PNAS

1001 ways for your pipeline to break

An overview of genomic pipeline
challenges

Christopher West Wheat

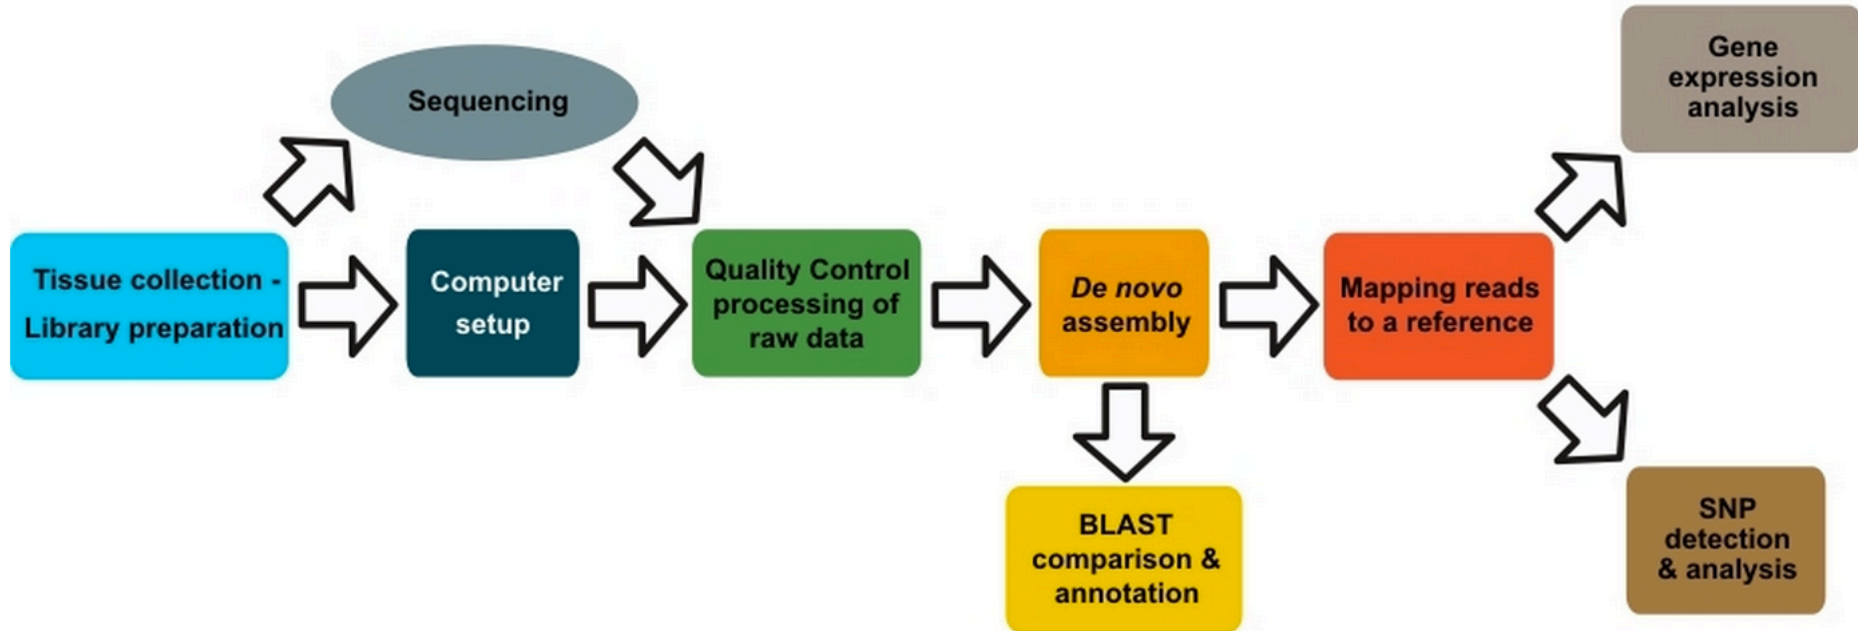

Informatics and Biology

- We need to make sure we put the 'bio' into the bioinformatics
 - Do results pass 1st principals tests
 - Always double check data from your core facility or service company
 - Use independent analyses as 'controls' on accuracy
 - What are your + and - controls?
 - Do independent methods converge?
- Need to re-assess our common metrics for potential bias in the genomic age
 - Bootstraps on genomic scale data
 - P-values, outlier analyses, demographic null models

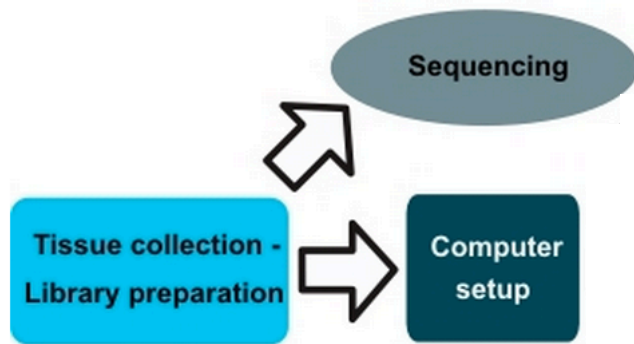

Outline

- Transcriptome analyses in non-model species
 - Walk through pipeline and highlight issues of concern
 - What is validation?
- Insights from candidate genes
 - Can Second Gen methods get us there?

Pipeline Overview

Pipeline Overview

How can I study
my data using
open source?

How
much
RAM do I
need?

Are 16 cores
enough?

Can I
use my
laptop?

What
software &
how do I
get it?

Why
Linux?

How much
HD space
is needed?

Computer Infrastructure

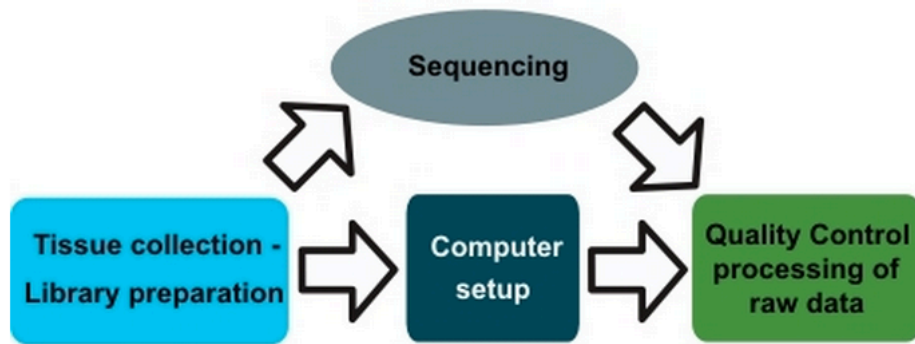

RNAseq dataset:

4 conditions X 2 tissues X 3 families X 3 replicates = 72×10^6 reads

	File Sizes (Gb)	CPUs	RAM (Gb)	Time
Raw files *.gz	(1.5)			~3 hours / file
Raw files expanded				
TA assembly				weeks
Mapping (BAM)				hours / file
Annotation	100			~6 – 12 days
Analysis	< 20 Mb	4	4	~< 1 hour
Visualization	BAM files	≥ 4	≥ 8	

Get ready for your data by downloading similar sized dataset from the Short Read Archive. Do not wait till it arrives

Pipeline Overview

Core facilities and non-model species

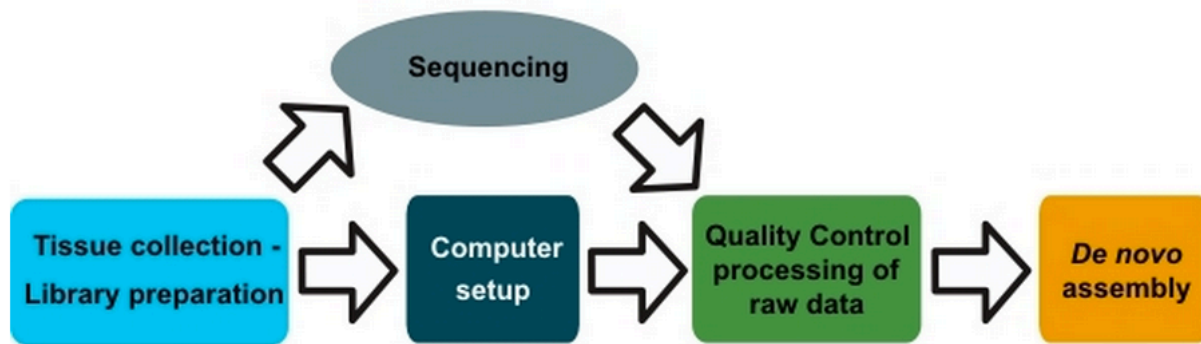

Statements from core facilities that are not true:

- **Here is your data**
- **You can't do RNA-Seq without a genome**
- **We'll have your data back in < 1 month**

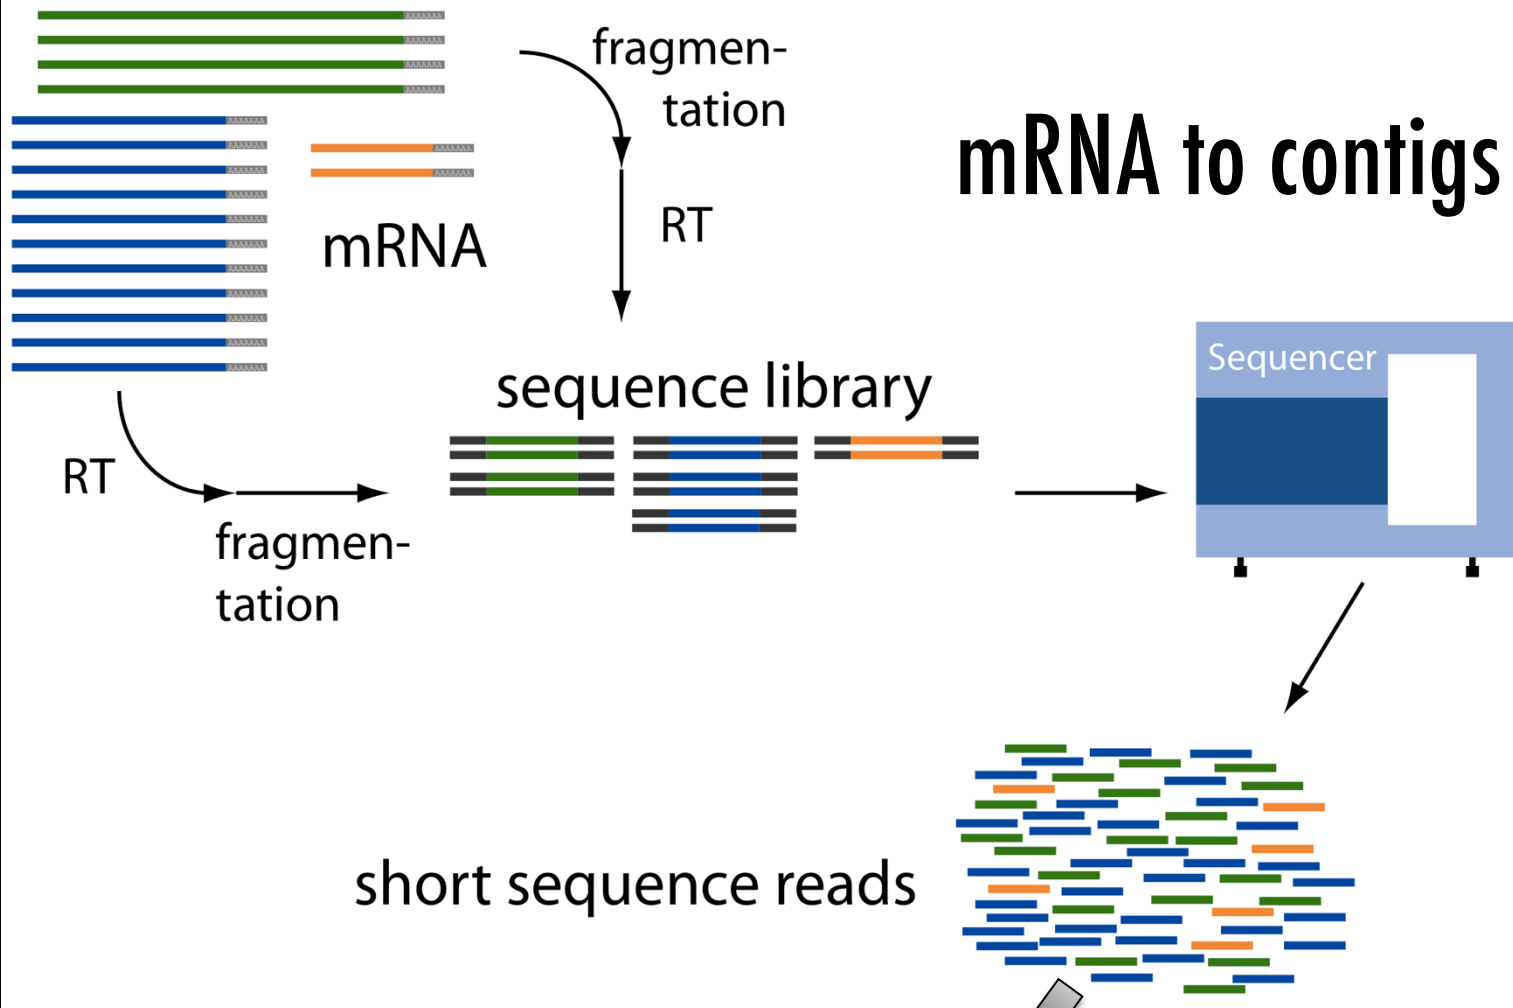

Duplication levels in RNA-Seq data

- Common in transcriptome work
- Starting with lots of high quality RNA increases
 - mRNA amount for sequencing
 - Decreases need of core facility to PCR your sample
- Moderate amounts of PCR duplication are OK
 - ~ 20% expected
 - > 50% perhaps problematic if correlated with experimental design
 - Clone_filter program in STACKS is excellent assessing this

Pipeline Overview

mRNA to contigs

Alternative splicing complicates everything

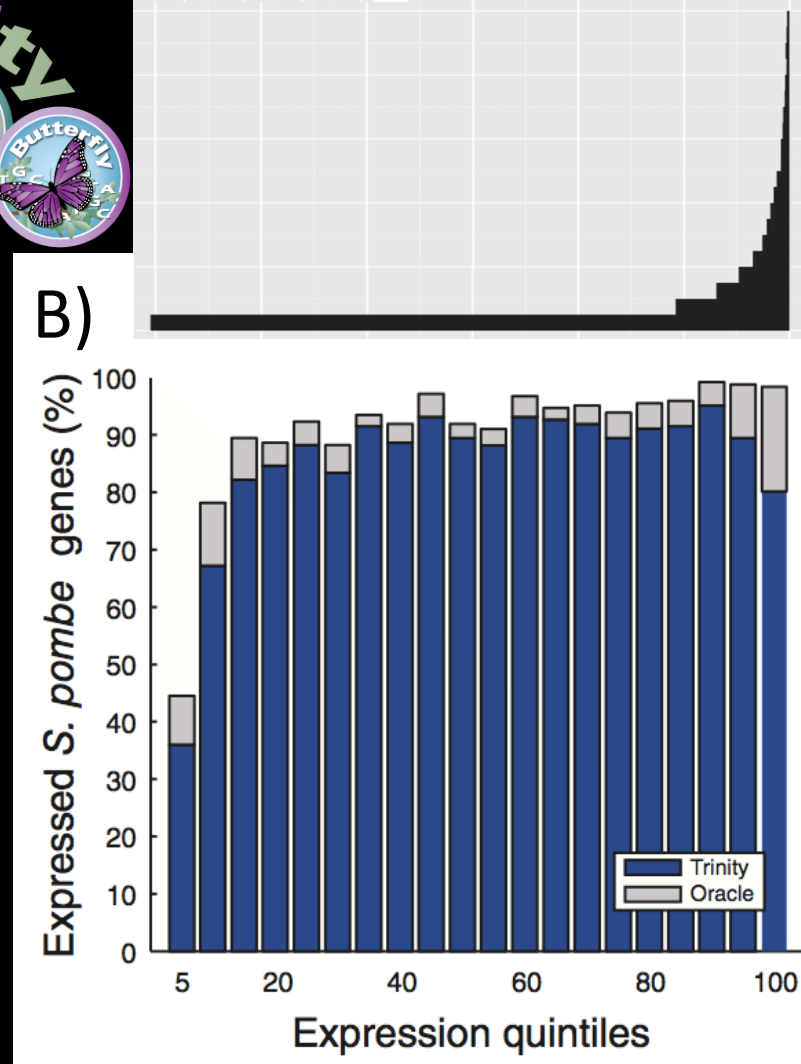

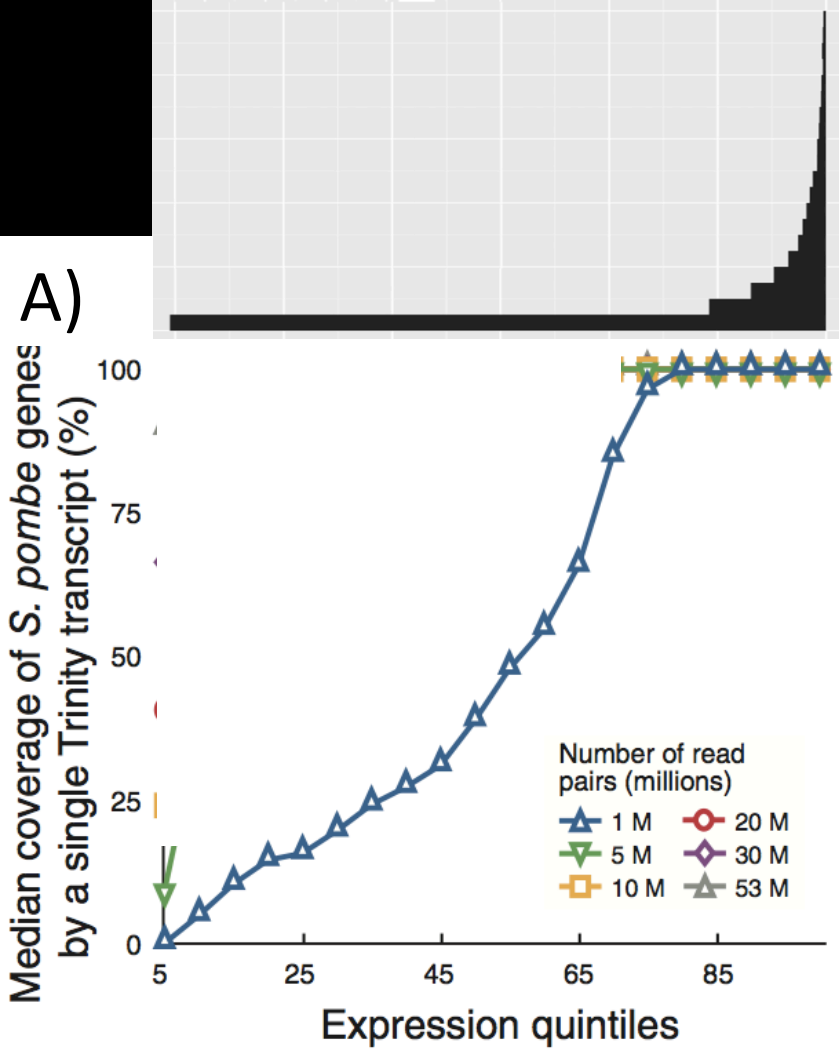

H. sapiens: > 95% of multi-exonic genes are spliced

De novo transcriptome assembly

Reconstructs splice isoforms using PE
Illumina data

A) At 53M reads, median coverage of lowest 5% quintile is 88%

B) With 53 M reads, of the total genes expressed at the 5% quintile, 47% are in the Oracle database and 36% were assembled full length by Trinity

BUT, when Trinity finishes

HOW do we know we did it right?

- Assessment metrics
 - Non-biological
 - N50, # of contigs
 - Biologically informative
 - # of orthologs identified
 - Ortholog hit ratio (OHR)

Assessing transcriptome assembly

Length = α

TA contig

$\alpha / \beta =$

Ortholog

Length = β

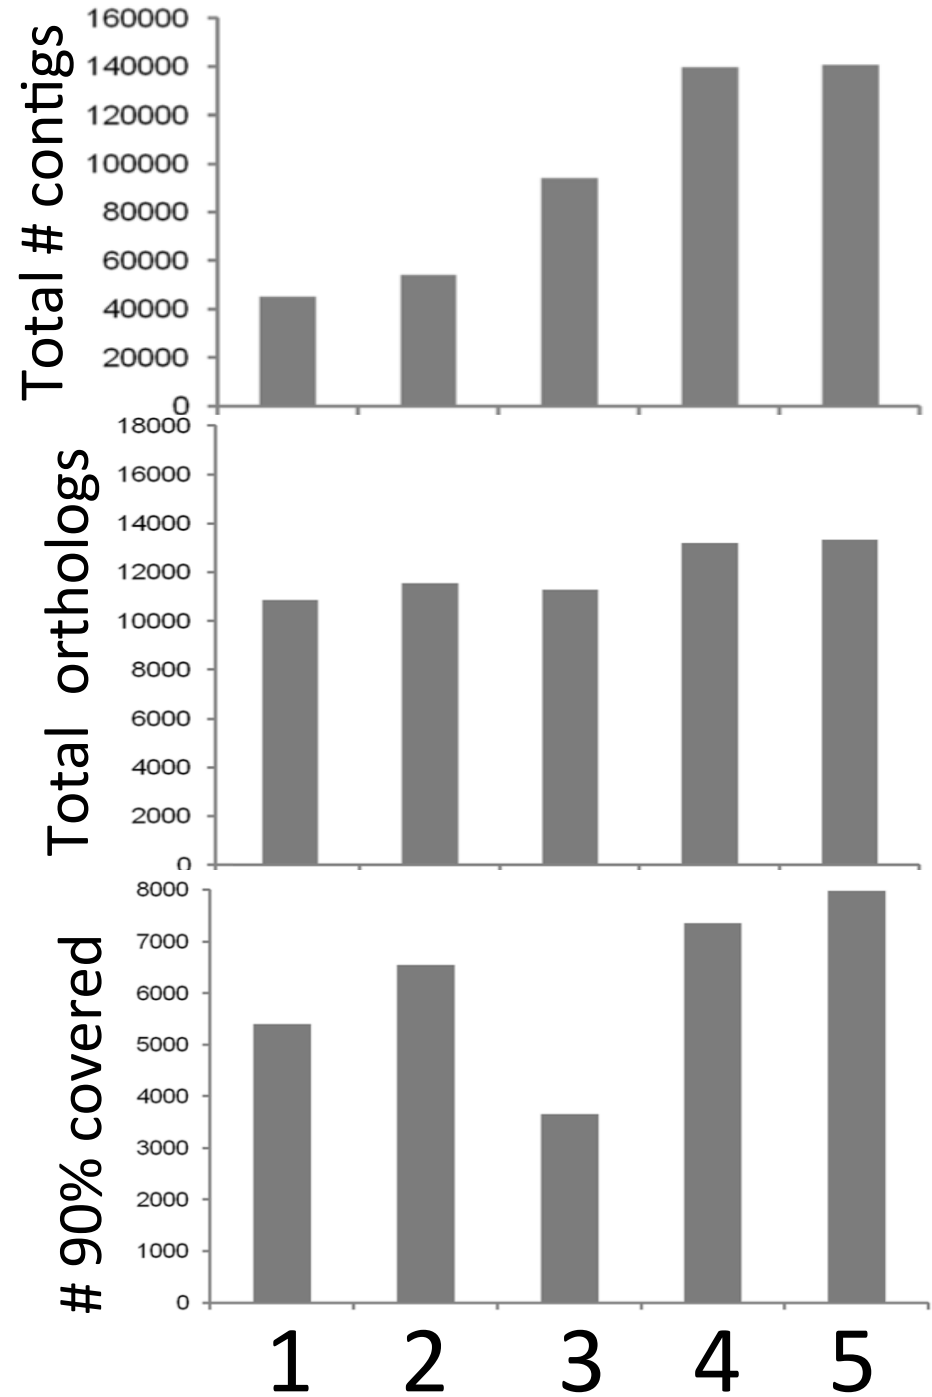

α / β :

1 = complete

< 1 = % covered

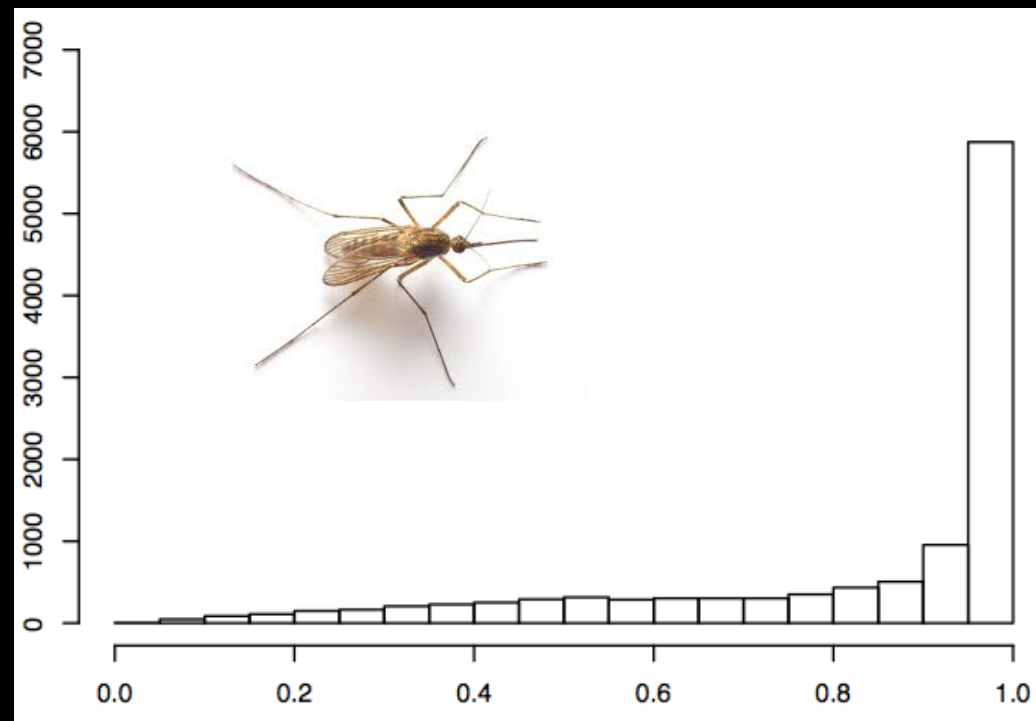

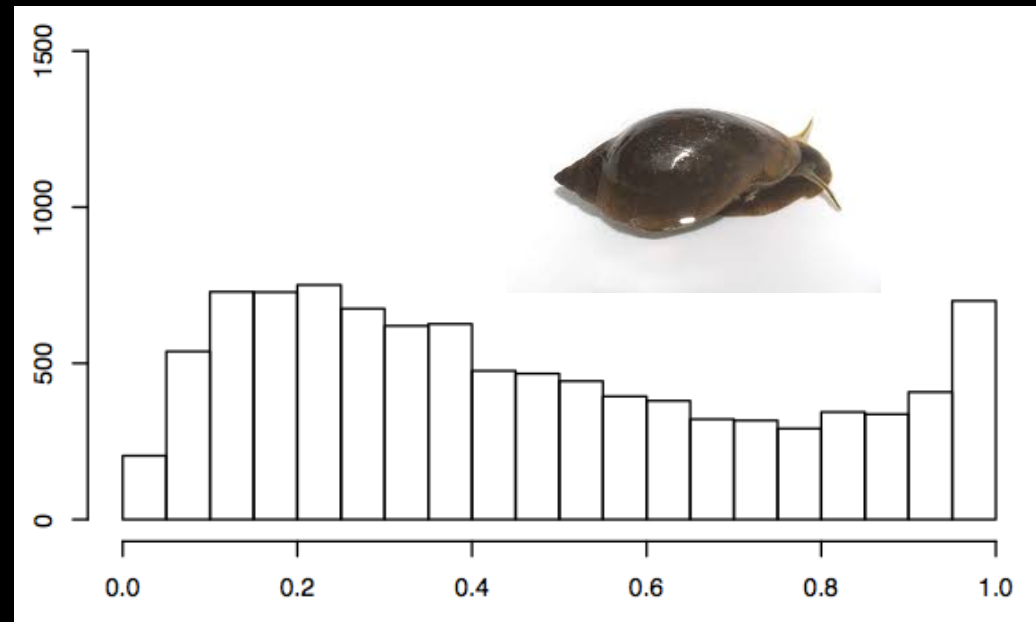

- 5 different TAs
- TA 2
 - Best N50, fewest contigs

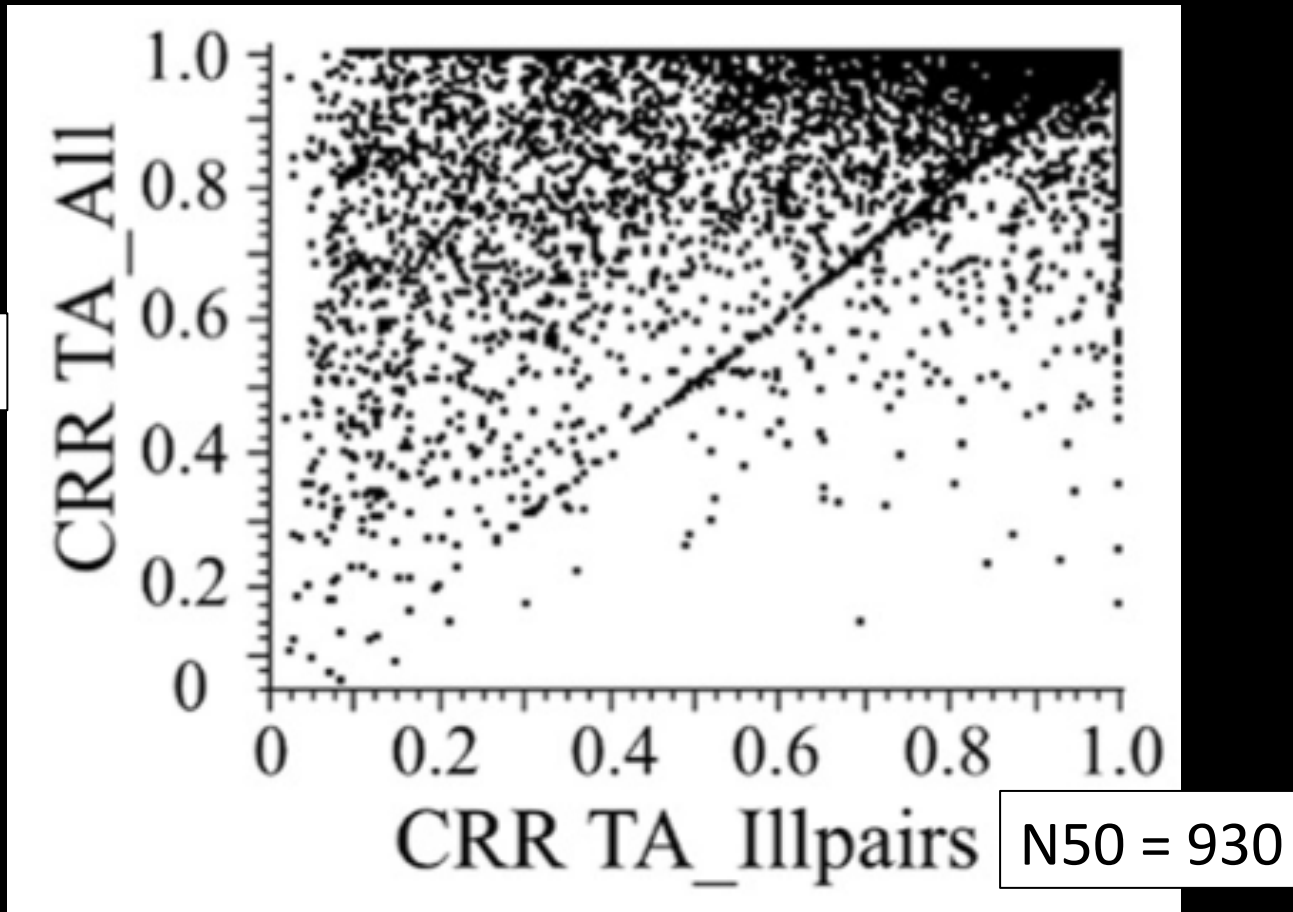

OHR graphs

- Shows the number of unique orthologs hit
- Distribution of their reconstructed length

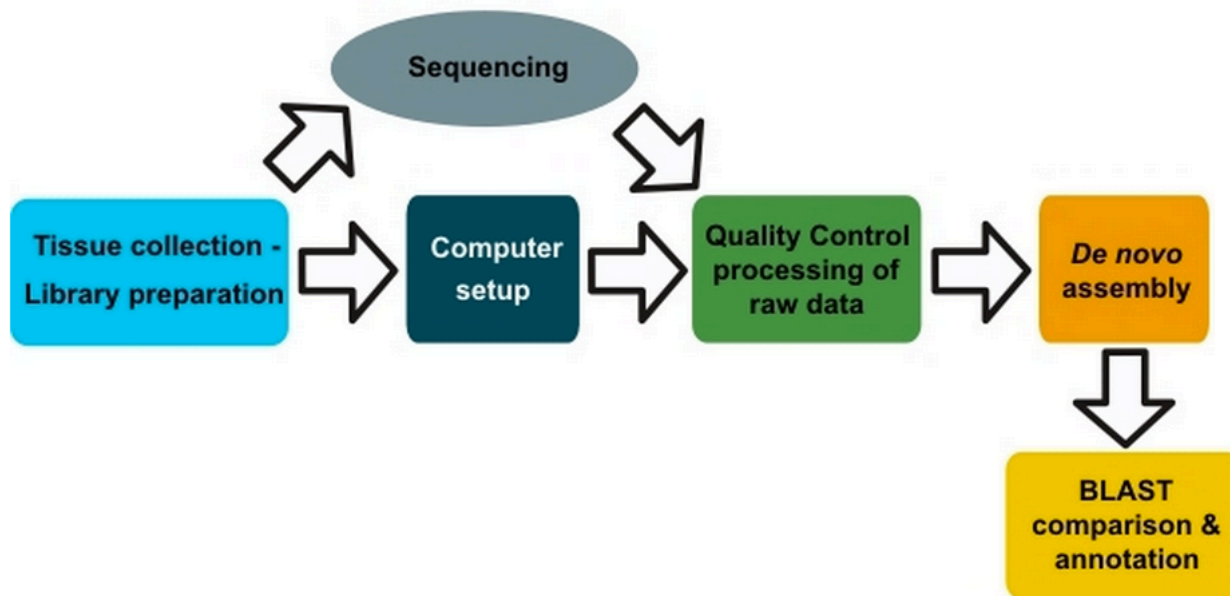

Comparative OHR

- Compare longest contig per ortholog for two assemblies
- Plot them against each other

Pipeline Overview

Blast: an alignment tool for identification

1) Input

- DNA or protein sequence
- Database of DNA or protein

2) Searches database

- Returns detailed matching information

Annotation

TA contigs

- DNA
- Search database of known proteins

BlastX

- Makes 6 frame translation of DNA into protein
- Searches DB 6 times

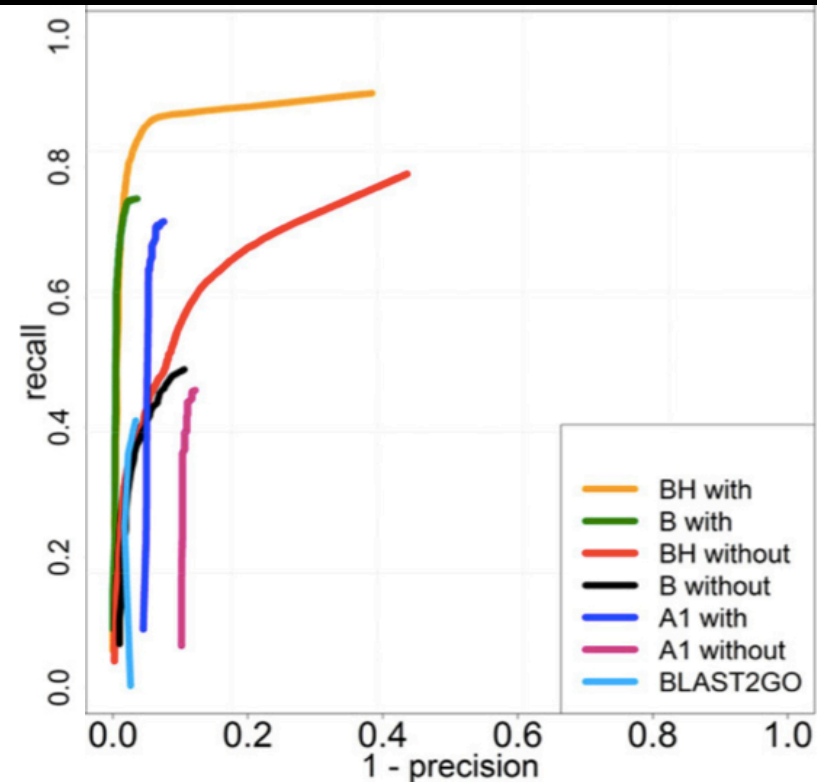

Gene Ontology: order in the chaos

- addresses the need for consistent descriptions of gene products in different databases in a species-independent manner
- GO project has developed three structured controlled vocabularies (ontologies) that describe gene products in terms of their associated
 - biological processes
 - cellular components
 - molecular functions

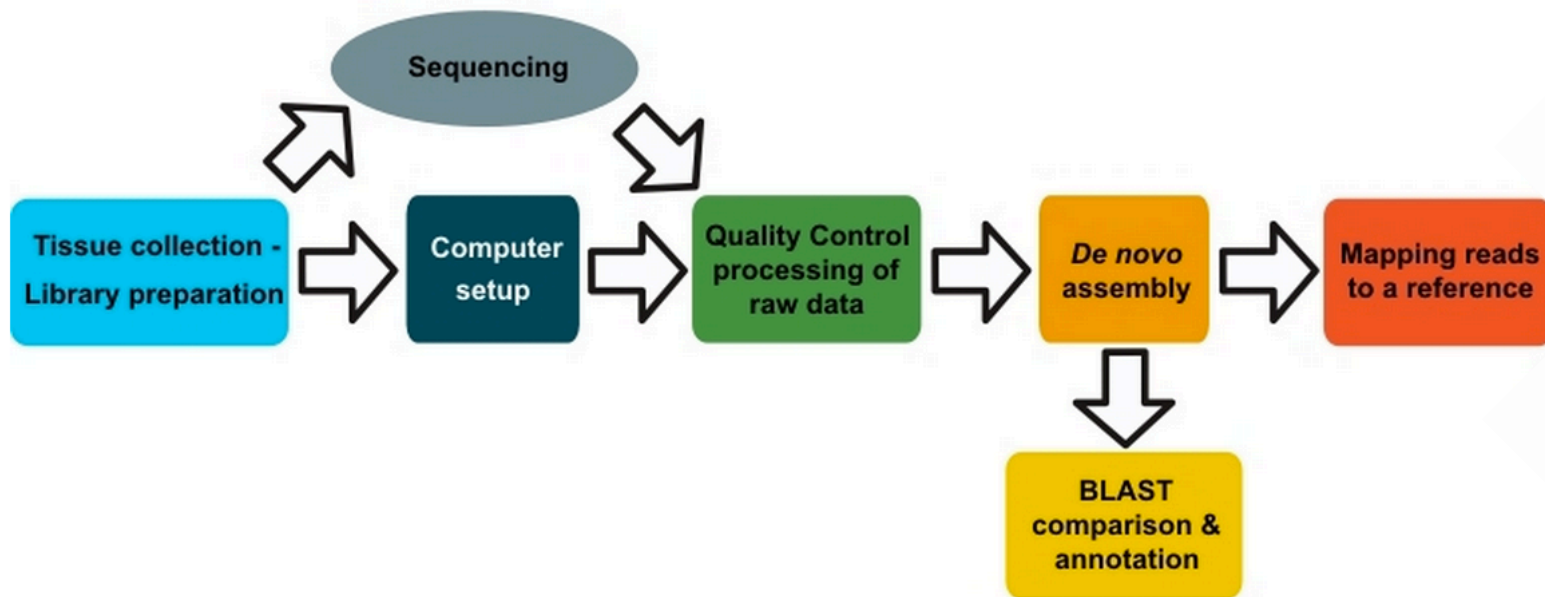

Comparisons among annotation tools

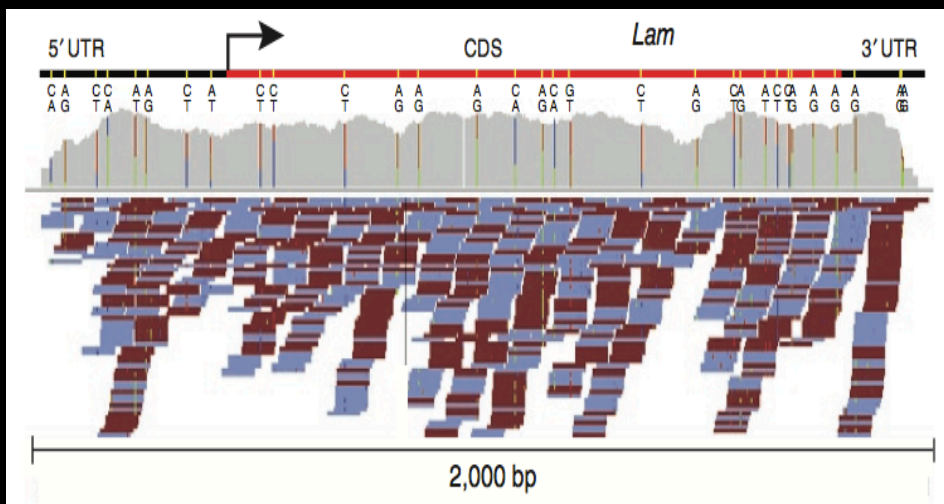

Radivojac et al.: A large-scale evaluation of computational protein function prediction. *Nat Meth* 2013, **10**:221–227.

Falda et al. Argot2: a large scale function prediction tool relying on semantic similarity of weighted Gene Ontology terms. *BMC Bioinformatics* 2012, **13**:S14.

Pipeline Overview

← Whole gene level

Exon level

Alternative splicing

Expression difference

De novo RNA-Seq: Do you need a genome?

No, but there are important biases & limitations

- TA mapping limitations
 - No exon level resolution but this will change soon
 - No coding information on identified SNPs unless you build gene feature files on contigs
- TA mapping biases unique to it
 - Splicing may cause mapping problems if locus is collapsed, but generally OK to not assume a gene model
- TA mapping biases shared with genomic mapping
 - SNP and indel effects
 - gene duplication (are reads mapping to the right place)

Map to TA vs. Genome:

which is better?

Template effects:

- **Mismatch :**
 - SNPs (single nucleotide polymorphisms)
 - Indels (insertion or deletion polymorphisms)
- **Pseudo-inflation**
 - An increase in the copy number of a gene that arise from genome assembly errors or TA errors
- **Gene model errors**
 - If the models in your genome are bad, this will affect results

Genome mapping

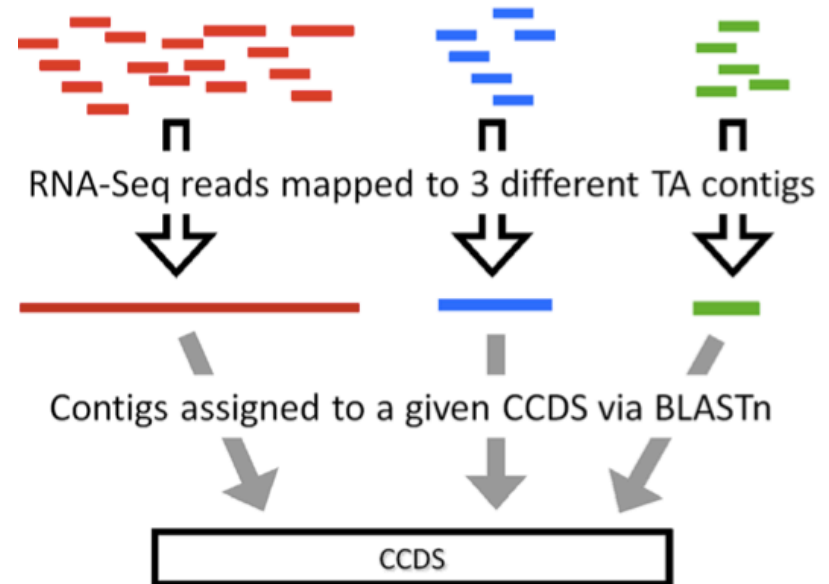

Spearman's $\rho = 0.95$, $P < 0.0001$

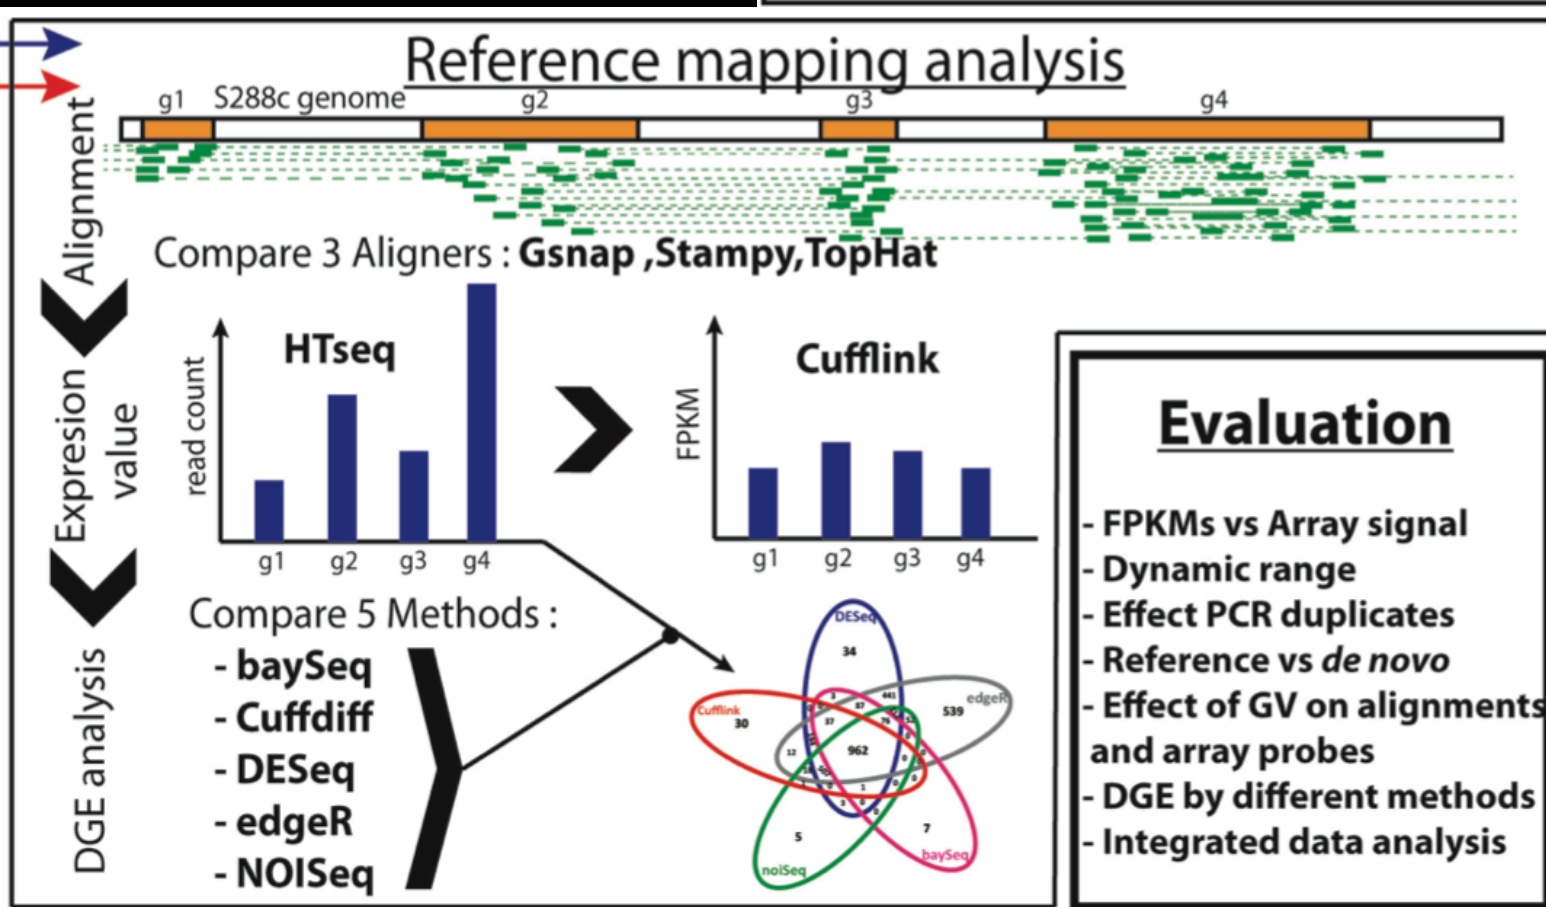

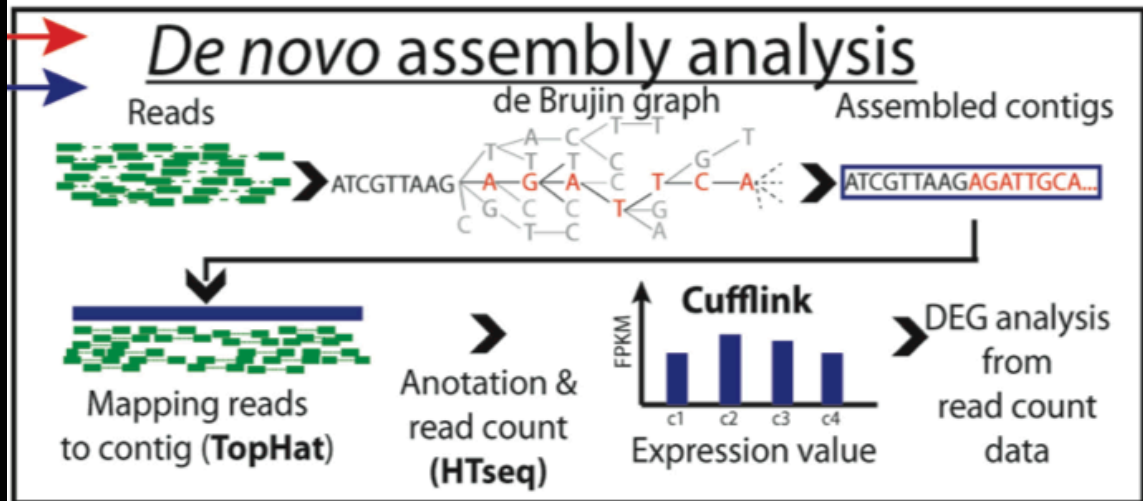

RNA-Seq mapping: comparing genome vs. TA

You can generate high quality data without a genome, for much of the transcriptome

Summed TA mapping

Template mismatch effects: excellent yeast study

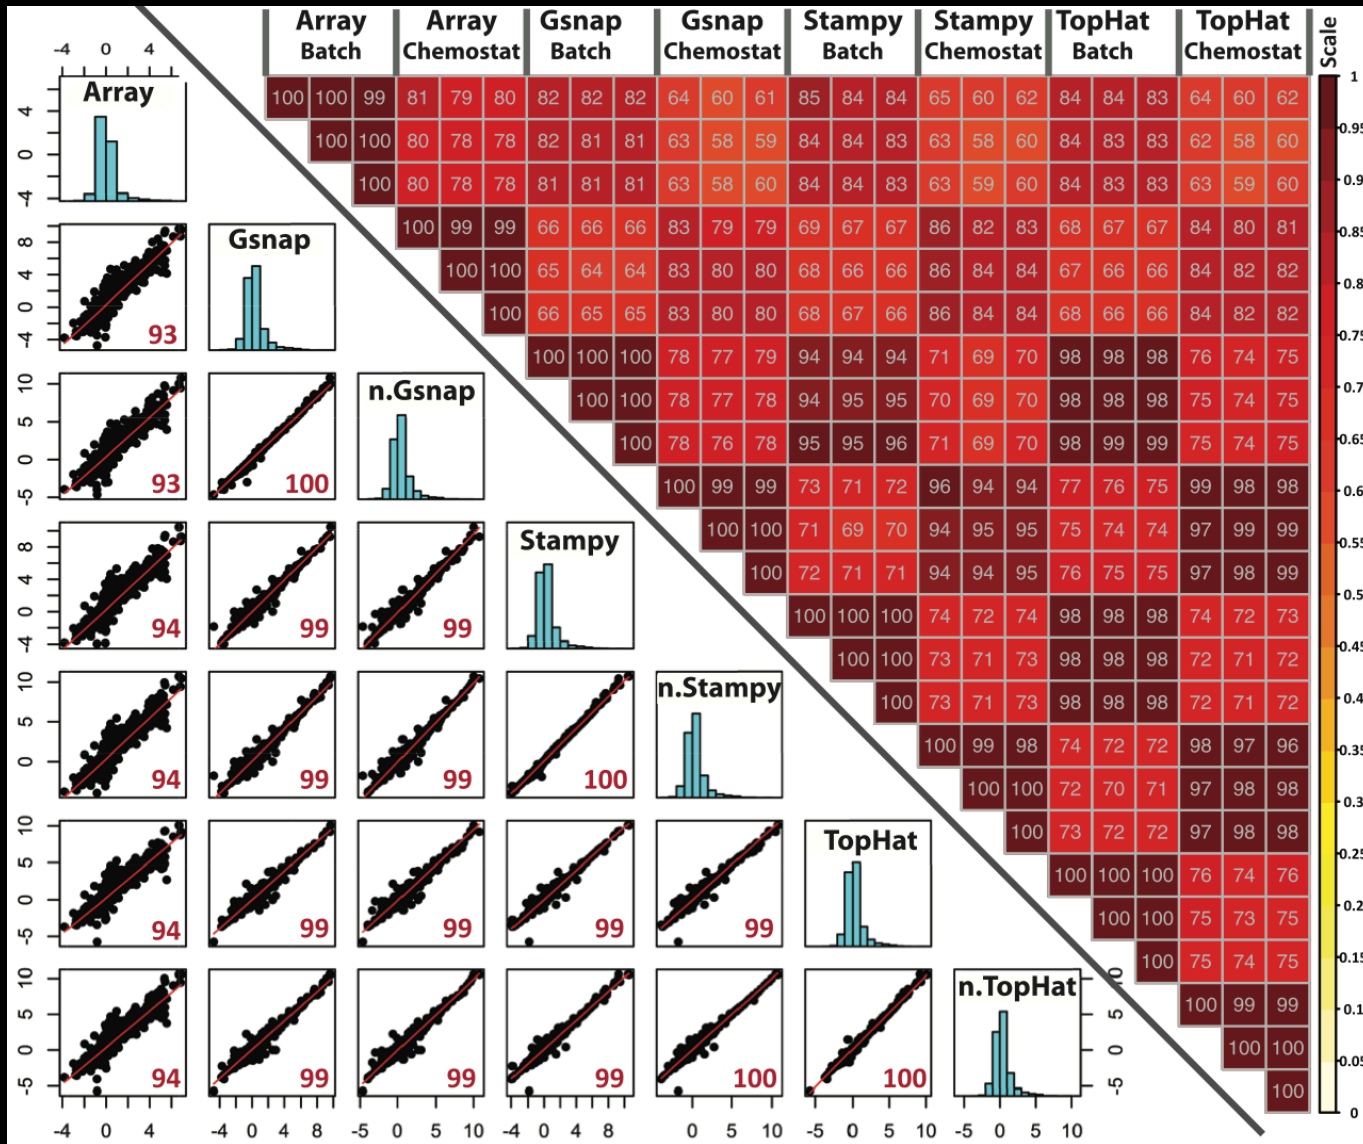

Evaluation

- FPKMs vs Array signal
- Dynamic range
- Effect PCR duplicates
- Reference vs *de novo*
- Effect of GV on alignments and array probes
- DGE by different methods
- Integrated data analysis

Does alignment software matter?

Mappers don't appear to matter

Wrong

- Genomic scale data can hide widespread biases that unless you specifically look, are hard to find
- Mapping programs differ in their settings and design
 - DNA to DNA vs. RNA to DNA
 - Are usually compared using species without much genetic variation
 - Indels, splicing, SNPs all affect mapper performance

SNP effects can be large

SNPs [SNV]

Insertions & deletions (indels) have large effects

B

15 mapping results

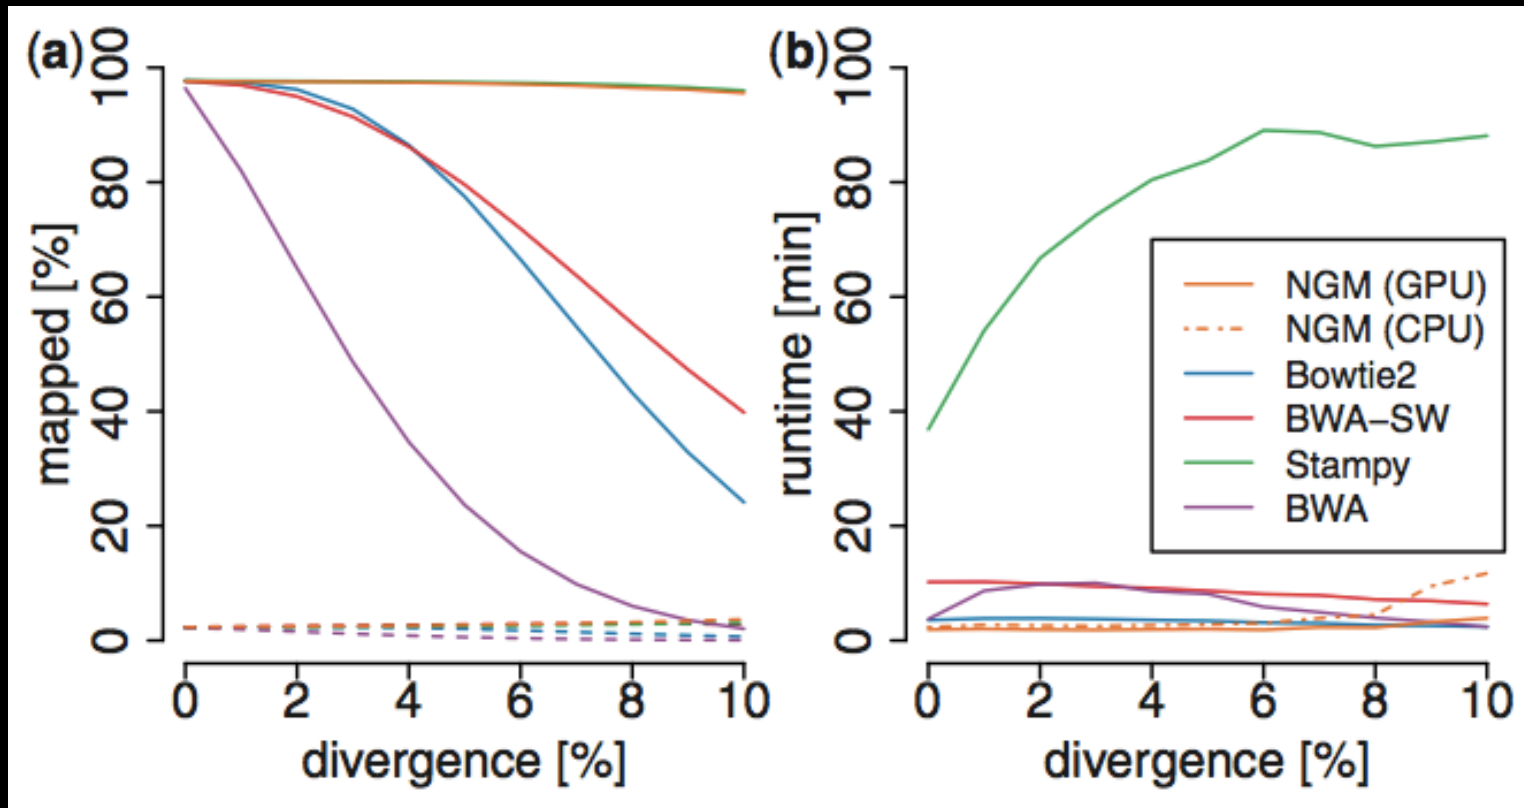

Dramatic differences in ability to handle a 2 bp insertion in reference compared to reads

TopHat, SpliceMap, Bowtie and Soap

- do not identify indels
- they fail to accurately align reads to these regions

Allelic bias in read mapping

- Essentially identical to allele specific PCR bias ... but on a scale you can't detect unless you care to look
- Do your genes of interest have more than 3 SNPs / 100 bp?

100 bp window with 4 – 5 SNPs differing from reference

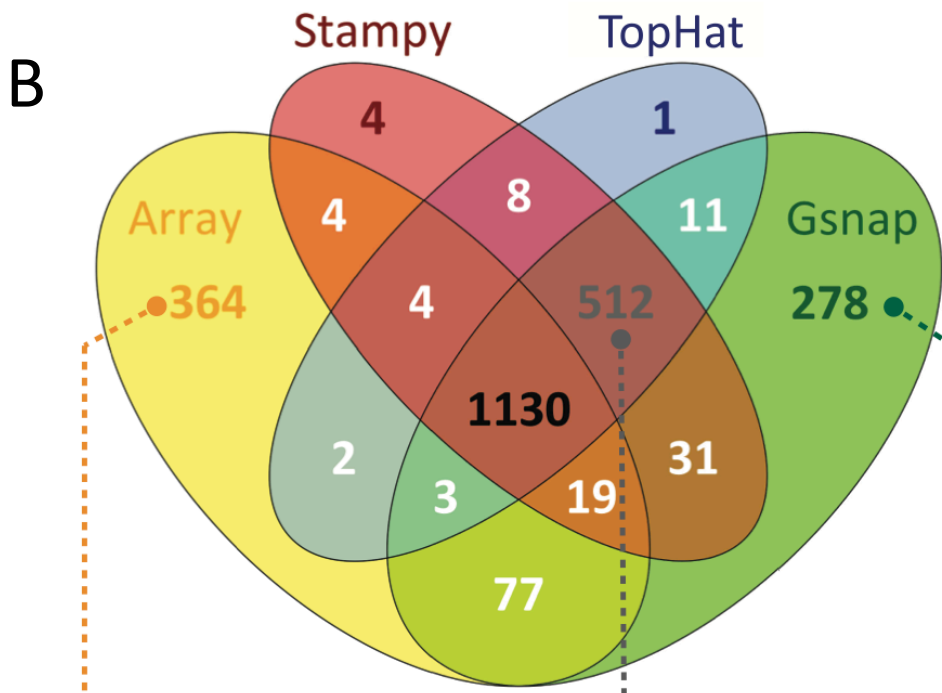

Mapping reads in outbred species

Average genome polymorphism levels (ignores indels)

Sig. expression differences by method

A: Stampy mapping
B: Cuffdiff analysis
C: Likely error source

Fatiscan Analysis

Most studies are annotation limited

- What is the biological meaning of the top P-value genes?
- Low P-value or expression genes are certainly important
- Gene set enrichments are key to insights
 - Thus, annotation is very important

Sources of error

Transcriptome assembly can be huge source of bias:

- Fragmentation creates multiple contigs of same gene
- SNPs and alternative splicing generates more contigs
- 1 locus = frag. X SNPs X alt. splicing = many contigs

We can observe effects in expression analyses:

- Family effect mapping bias
- Pseudo-inflation in Gene Set Enrichment Analyses

Put the **BIO** in your informatics!!

Use independent analyses as 'controls' on accuracy

— What are your + and - controls?

	Analysis # 1	Analysis # 2	Analysis # 3
Mapper	TopHat2	STAR	?
Normalization	none	RPKM	TPM
Analysis	PCA	RSEM	EDGER

Should independent methods converge?

Interrogate your results

- This will give you confidence
 - Bring freedom to your findings (no waterboarding)
- Graph your results
 - PCA plot or similar
 - P-value distributions
- Assess gene copy number in gene set enrichment analyses (GSEA)
 - Do these levels fit to 1st principals expectations?
 - Do you have extra copies due to your Transcriptome assembly?

Normalization & Analysis

WILD WILD
WEST

Life after your RNA-Seq experiment

— What are you likely to learn?

- By measuring other aspects of the phenotype, you can validate and solidify your transcriptome insights

— What may limit your insights?

- Single gene analyses can be restrictive

- Statistically: FDR is very conservative

- Biologically: genes work in networks varying in expression and direction across pathways

— Possible solutions

- Gene set enrichment analysis: harness the functional network
- Collect additional data relevant to your phenotype and organism
 - Don't hesitate to make your own enrichment set

A major challenge for Ecological Genomics

- What causes natural selection in the wild?
 - How does genetic variation at one region of the genome interact with its environment (genomic, abiotic, and biotic)
- DNA alone can't tell us about selection dynamics in the wild
 - Molecular tests are very weak and uninformative about selection dynamics
- Research community is demanding actual demonstration of natural selection when making claims of adaptive role

To address these we need to develop functional genomic insights in species with well understood ecologies that can be manipulated in the lab and in the field

Molecular spandrels:

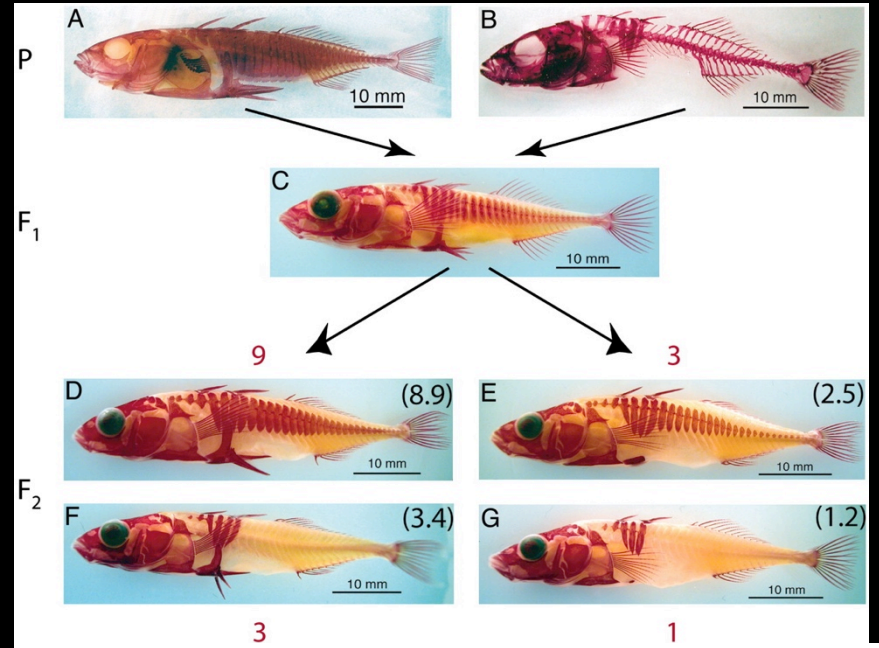

Story telling
vs.
causal understanding

Genomics of full of adaptive stories

Functional and field validation of
SNPs effects are needed to discern
facts from fictions

Model adaptation: the *Eda* gene

- Causes loss in body armor
 - Field association
 - QTL mapping
 - Gain-of-function assay

Ac Gain-of-function

Back to nature: do we know what we think we know?

- Is low armor really adaptive in fresh water?
- Lets replay the selection event
 - Equal frequency *Eda* alleles in fresh water ponds

Studies in the field can uncover unexpected and complex selection dynamics

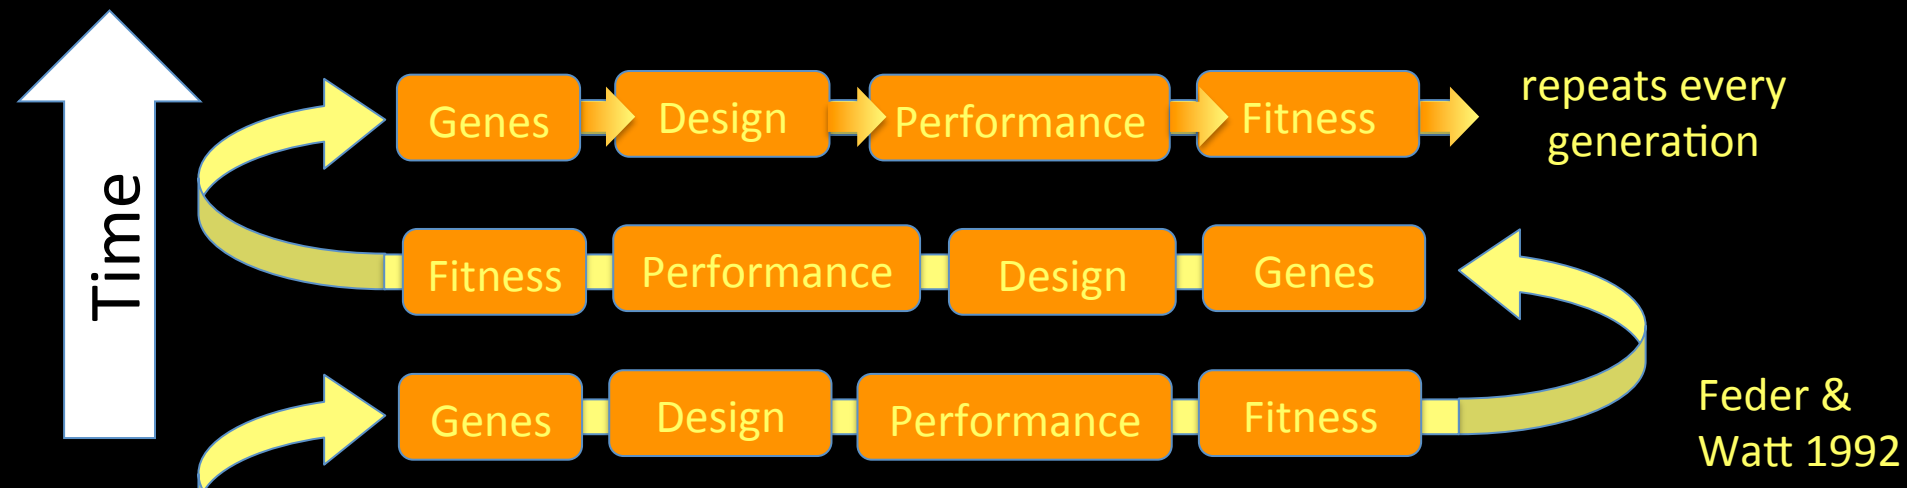

- Linked effect of other genes in the inversion on LG4?
- Is *Eda* the target of selection?

4 replicate freshwater ponds

Adaptation by natural selection

Common mistakes

- **Blindly trusting bioinformaticians: look at your data!!!**
- **Mapping reads to a very divergent genome**
 - Only most conserved genes map: bias due to divergence and mapping thresholds
- **Not accurately assessing a TA**
 - Your template determines quality of results
- **Not enough reads, replication, or statistical power**
 - Large amounts of data to not change fundamental statistics (never pool unless necessary)
- **Not assessing likely biases in analyses**
 - Try different mapping thresholds & analysis methods to assess convergence of biological signal
 - Assess alternative splicing and duplication potential in findings
- **Data size and computational power are demanding**
 - Download data and work with it before your real data comes.

Table 1. Programs, modules, toolkits, and packages required in order to run through this pipeline in its full mode. If you want to carry out this pipeline on a Windows platform, you will need to have a Unix portal, such as Cygwin, installed or run Linux in addition to Windows. If you do not intend to go through all steps, some software might not be needed.

Software Name	Description	Where to find it	Step(s) that require(s) this software
Ubuntu Linux	Ubuntu is one of many Linux versions. The advantage of Ubuntu, and many other Linux distributions, is that it can be easily installed and removed on a Windows PC or a Mac, without need of reformatting your hard drive.	(Mac OS X or PC) http://www.ubuntu.com/	All (not needed on Mac)
CygWin	CygWin is a Unix-environment portal that allows you to run most of the Unix-formatted software described here on a PC.	(Windows only) http://www.cygwin.com/	All (not needed on Mac)
Xcode	Xcode is a suite of application tools from Apple that includes a modified GNU Compiler Collection (supports basic	(Mac OS X only) Xcode 3 or 4 http://developer.apple.com/xc	All
